

Create and Deploy Custom Remediation Content

Today's endpoint security threats are coming at you faster and via more avenues than ever before. Zero-day threats are now a reality, and configuration related issues present constant workload to administrators and help desk alike. Getting ahead of these, and other PC-related issues, has been a moving target – until now.

With PatchLink Developers Kit, you can quickly and easily create intelligent change packages that can dynamically identify and correct a variety of problems, from simple configuration issues to blocking Zero-day threats – *proactively*. Once created, these packages can be seamlessly uploaded into your PatchLink Update repository for automatic deployment, continuous validation, and ongoing status reporting.

Enforce Configuration Policies

PatchLink Developers Kit

Managing the hardware and software configuration settings for every machine on your network is a time-consuming, yet critical task. PatchLink Developers Kit allows you to develop custom packages that identify systems that have drifted out of compliance with corporate configuration policy, and then quickly remediate the issue, returning the affected systems to their desired state. Working in conjunction with PatchLink Update, PatchLink Developers Kit enables you to create and deploy remediation packages that address a wide range of configuration related issues, such as closing down vulnerable ports, shutting down dangerous services, identifying and removing unauthorized or expired files and applications, enforcing password policies and registry settings, and much more.

Respond to Zero-day Threats

PatchLink Developers Kit provides a defense against the increasing number of situations where software vulnerabilities are identified and exploited before a corresponding patch is publicly available. This rapid vulnerability exploitation, commonly referred to as a “Zero-day Threat”, provides a substantial challenge to IT organizations. PatchLink Developers Kit allows you to react immediately, identifying all machines that contain the Zero-day vulnerability and automatically deploying a custom script to blocks access to the vulnerability on all exposed endpoints until the software vendor is able to produce and distribute an authorized patch.

Features & Benefits

Flexible Content Creation : Custom remediation packages can be created to address a wide range of software and configuration threats, distribute or remove applications and files, enforce configuration policies, and more

Rapid Content Development : Intuitive, easy to use interface allows you to develop custom packages in minutes to react to the latest threats

Immediate Content Distribution : Content is seamlessly ported into your PatchLink Update repository for automated, enterprise-wide deployment.

Applicability Testing : Custom packages can be wrapped with intelligence using our patented Fingerprint Technology™, allowing you to test machines for applicability before distributing packages throughout your network

Broad Coverage : Custom packages can be deployed across your heterogeneous network to any machine that contains a PatchLink Update agent.

Continuous Monitoring : Custom packages created with PatchLink Developers Kit can be continually monitored and reported on through the PatchLink Update interface

Secure Closed Networks

Just because a network (or network segment) is isolated from the Internet, does not mean that it is free from security threats. The 2006 E-Crime Watch Survey™ conducted by the United States Secret Service (USSS), the SEI CERT® Program, and CSO Magazine discovered that almost one third of electronic crimes were perpetrated by insiders. PatchLink Developers Kit allows you to secure machines in this type of highly secure environment, where downloading ongoing patch subscriptions is not possible.

Distribute Software and Data

PatchLink Developers Kit provides the ability to rapidly distribute applications or data files throughout your organization. This distribution is not limited to commercial software applications, but can also include items such as the latest Antivirus definitions, proprietary applications, user documentation and other files that you need to rapidly deploy to a large and diverse number of machines.

Develop Custom Patches

PatchLink Developers Kit enables you to develop software patches for home-grown applications, or legacy software that is no longer supported by the manufacturer. These custom patches can include fingerprint signatures that allow you to assess their applicability to target machines. Once developed, these custom patches are easily uploaded into the PatchLink Update assessment, remediation and validation process. PatchLink Developers Kit also allows you to open and modify content contained in your PatchLink Update repository, allowing you to edit any of our more than 15,000 existing vulnerability remediation packages to meet the unique needs of your organization.

“Today's threat landscape has changed. Corporate security threats have become more multifaceted, networks have become more open, and hackers are becoming targeted, better and faster.”

IDC 2007

How It Works:

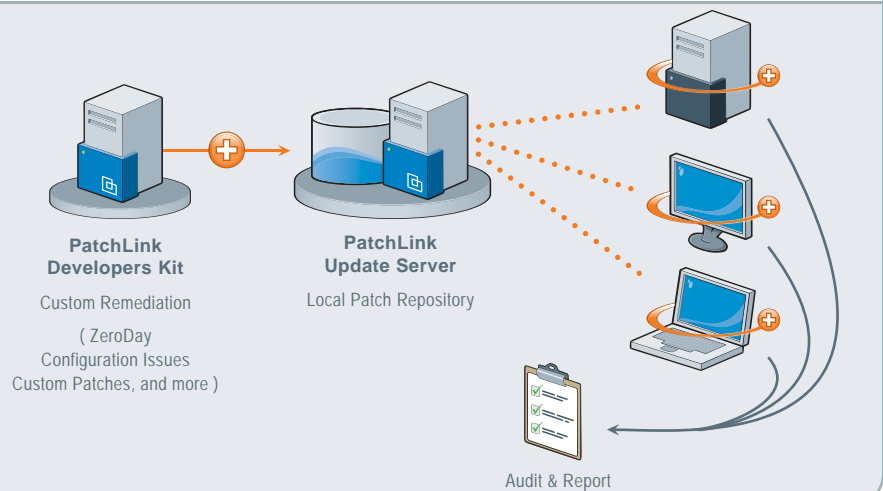

Custom configuration and software remediation packages are created using PatchLink Developers Kit

Custom remediation content is seamlessly uploaded to PatchLink Update Server

Utilize PatchLink Update to assess applicability of your custom packages across your enterprise

Deploy your custom content to all managed end-points using standard PatchLink Update deployment tools

Validate, audit and report custom patch efficacy

Address Your Environment's Unique Issues Today

PatchLink Developers Kit is a powerful security content development tool that allows you to respond to the growing number of threats that target configuration errors or software vulnerabilities for which there is not a publicly available patch.
